

CSC 345 - Project #2: AI Use Essay

Throughout the completion of Project 2, we used artificial intelligence to gain a better understanding of the material and the expectations of the assignment. The type of artificial intelligence we specifically used was Claude.

When beginning the project, we found as many resources as possible, whether it was on GitHub, GeeksForGeeks, or various Linux forums. This helped quite a bit with the project and helped me get the first four requirements completed and working. When we ran into difficulties, we used Claude to further explain concepts to implement them into the project.

Another use we had for artificial intelligence was for debugging. This was incredibly helpful, as we had several small errors that would've been difficult to catch checking line-by-line. At one point, the code was compiling but not giving a correct output, and it turns out the error was mixing up the `checkRows1` and `checkCols1` functions. An error like that would've taken a long time to catch, whereas Claude caught it immediately.

Furthermore, we would ask specific questions about why things weren't working. I'd only take this path after looking at forums and websites online. Using artificial intelligence for this reason was also very helpful and explained what was wrong in a way that still allowed me to solve the problem myself.

Overall, I found using artificial intelligence helpful in completing this project, but not to the point where it was necessary. I especially liked using Claude, as I feel it allows the user to not rely on artificial intelligence but truly use it as a tool.
